

IPS CONNECTIVITY TESTING

V 1.0

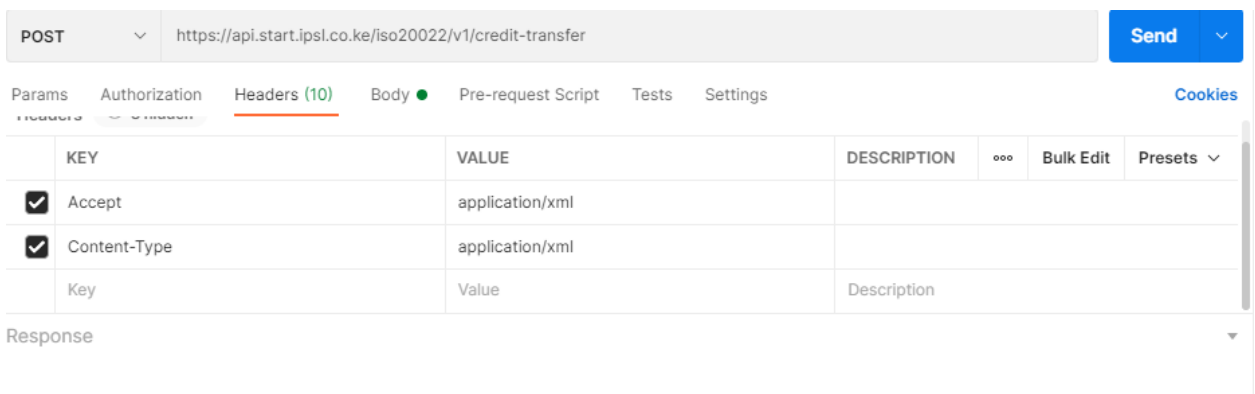

25th Mar 2021

IPS Connectivity Testing Procedure

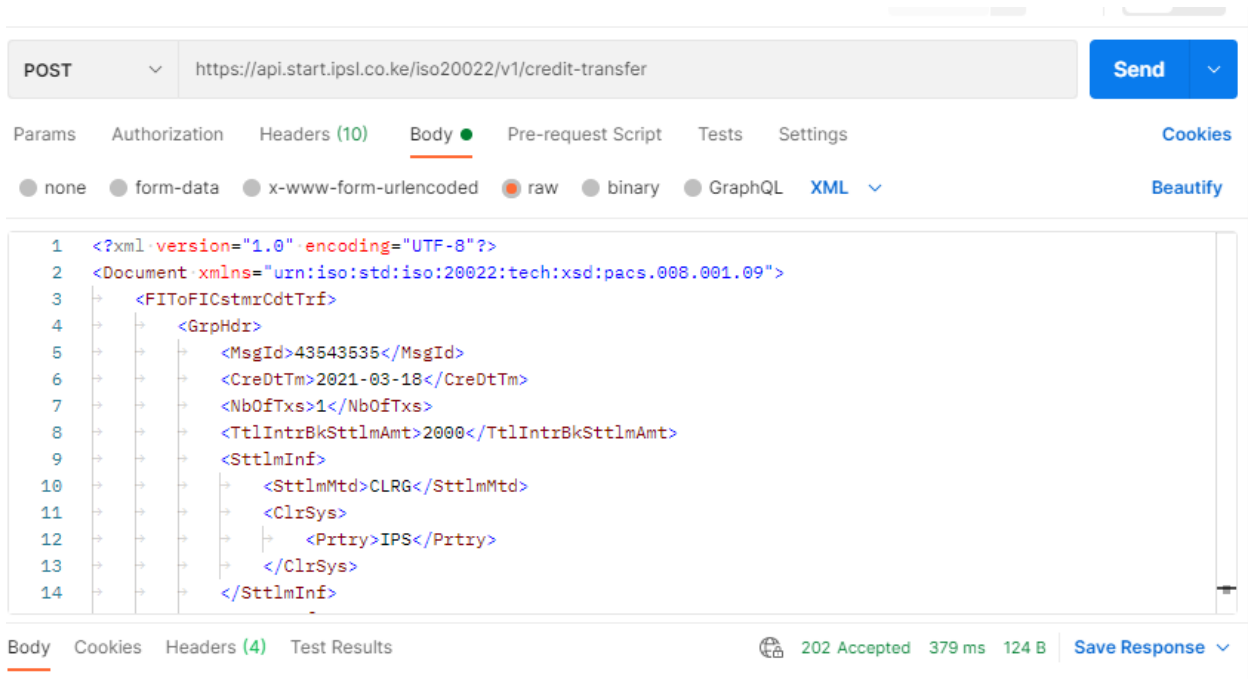

1. Download Postman for your Operating System from the link below and install:
<https://www.postman.com/downloads/>
2. From Postman window, go to File->Settings. You should see the window below. Load your ca chain certificate, transport certificate and transport key as indicated:

3. Go to the Headers tab and set both **Accept** and **Content-Type** headers to **application/xml** as shown below:

- Go to the Body tab and enter the message you would like to send to IPS as shown next. If you send a credit-transfer message, you should get back a status code 202 response, indicating that the message has been “Accepted” for processing.

As show above, the base URL for IPS was extended to:

<https://api.start.ipsl.co.ke/iso20022>

All endpoints are derived from this base URL. For example “/v1/credit-transfer” endpoint the swagger file translates to:

<https://api.start.ipsl.co.ke/iso20022/v1/credit-transfer>

- Once connectivity has been confirmed, you can then proceed to integrate via code.
